**Abstract**

Use of Poka-Yoke for the improvement of SMEs and MSME. The Poka-Yoke was first presented by Japanese people that stay away from unintentional accidental mistakes in the manufacturing organizations. The point of Poka-Yoke is to diminish inadvertent human mistakes underway manufacturing processes and the administrators because of mental and physical human flaws. By using the tool the manufacturer can achieve the normal goal through the transfer of expelled items.

**Keywords;** *Poka-Yoke, TQM, Mistake, Producer, Quality, Restricting..*

## I. INTRODUCTION

The expression Poka-Yoke has been present from the Japanese words Poka (accidental errors that one can make) and Yoke (to avert). In 1960s Shigeo Shingo presents the Poka-Yoke system. Poka-Yoke has two fundamental various capacities for example control and caution. The essential point of Poka-Yoke is to outline the process with the objective where errors are impossible or basically can be perceived and amend and besides to diminishes the human mistakes in manufacturing industries and in the assembling system on account of the mental and physical human defect [1]. Each assembling businesses need to achieve a higher advantage. To reach that level of flawlessness of items is vital. The Small Manufacturing Enterprises (SME's) and MSME's go about as trader for the associations. More flawlessness on work is required in SMEs and MSME [2].

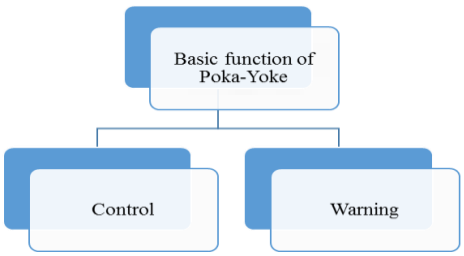

**Fig. no 1: Poka-Yoke basic functions**

Since the system of Poka-Yoke can be used there to take out errors in the SMEs. In the present competitive world, any association needs to make great quality, deformity free modern items at an ideal rate. The innovative culture of TPM (Total Productive Management), TQM (Total Quality Management) in the assembling similarly like administration division acquaints various strategies with the expands the nature of items. By using different tools of TQM like JIDCO, KAIZEN, POKA YOKE, 6 sigma's, FMS, JIT, etc. association is required to make worth culture. The research is proposed to focus fundamental thought of Poka-Yoke, various kinds of Poka-Yoke, ways to deal with achieving a simple Poka-Yoke system [3], [4].

## II. TECHNIQUE POKA-YOKE

Poka-Yoke is a precautionary act that concentrate on recognizing and expelling the remarkable purposes behind various assembling forms, which unavoidably lead to assembling item's dissensions or distortions. Poka-Yoke is the Japanese improvement technique for staying away from simple human mistakes in the work environment. This thought was from the outset called "Idiot Proofing" yet it

was comprehended that this name may heart workers so term “Mistake Proofing” was present by Shigeo Shingo. These systems are down to earth, easy to understand just as financially savvy. Poka-Yoke gives a system and plan for forestalling errors at the source. It is one of the critical systems to add to any associations Constant improvement. To sum up, Poka-Yoke is a continuous improvement method that suggest a way to deal with change the QMS (Quality Management System) towards a progressively remarkable degree of execution [5]. The Poka-Yoke thought was made in the mid-1950s by Shigeo Shingo the one who is a Japanese Industrial designer. He was employed for Toyota and other different Japanese associations, where he made complete engineering systems focused on achieving zero defects in manufacturing and acquaints this progressive work with the world. The fundamental thought driving Poka-Yoke is that it isn't sufficient and allowed to make even an unassuming amount of odd product. To proceed in the market and to transform into a world-class contender, accompany must go with a better approach for intuition and development close by one alongside the other demonstration of conveying zero defect. Poka-Yoke procedures are the especially basic and essential thoughts for achieving this goal and are a key piece of the consistent improvement system in many top Japanese associations on this development. Poka-Yoke is one of the performances of "good kaizen", or consistent improvement considering its preventive nature. A Poka-Yoke system is any system of thought that either keeps up a key good techniques from the error from being made or makes the error successfully perceived at first. The capacity to find errors at first is noteworthy in light of the fact that that, as Shingo states, "The reasons for absconds lie in laborer errors, and defect are the aftereffects of ignoring those errors. It pursues that errors won’t transform into abandons if specialist errors are found and dispensed with beforehand". He likewise adds to this that "Deformities emerge on the grounds that mistakes are made; the two have a circumstance and logical results relationship. However, errors won't transform into deserts if input and move make a place at the mistake stage [6]–[8].

During the production of any item, there are very easy and redundant advances that are finished by the administrator. These uninteresting work result into mental depletion and absence of eagerness for work which in the long run causes senseless errors of administrator and we realize that human is slanted to do errors in spite of the way that he doesn't need it. To avoid these fundamental errors Poka-Yoke thought plays an significant role. By presenting some essential plans we can keep up a key good way from mistakes. It lessens the work weight of laborers and we can use the creative mind and exceptional aptitudes of workers for dynamically innovative errands instead of growing weight for monotonous exercises. This commitment of everyone in the industry is a basic requirement to rise establishments of value principles in the business [8], [9].

## III. LITERATURE REVIEW

Poka-Yoke is a strategy for keeping up a key good way from fundamental human errors at the workplace also known as called botch sealing, goof proofing. Poka-Yoke is a basic system introduces to mistakes made by workers during working. The primary point of the Poka-Yoke strategy is to dismiss or decline human errors in various associations and the administration as a result of psychological and social blemishes. Development errors are reliably the key worries of the development associations. At the point when an error or error happens, and it is rectified then this can be known as revise, which is the inconsequential effort of re-attempting, adjust a development or system that was mistakenly actualized in the main go through. Poka-Yoke system was exhibited by Shigeo Shingo in 1962 when he architect at Toyota Motor Corporation. This procedure, in a manner of speaking, is to avoid flaws and errors starting in the mistake. Shigeo Shingo being a promoter of factual procedure control systems in Japanese associations comprehends that such an answer would never improve the manufacturing procedure [3], [10]. Consequently, it is started in Japanese enterprises to execute a Zero Quality Control (ZQC). One of its segments executing the standard ZQC is basically a Poka-Yoke procedure. In-Service segments likewise of conventional associations can be understood about the mind-blowing ability of Poka-Yoke is a straightforward technique for flexibility and accessibility. One can't avoid all mistakes, anyway can make it easier to do the work right, regardless of the way that errors will even now happen. Instead of empowering techniques to continue after an error has been made, Poka-Yoke could be used to stop them [3], [9], [11].

## IV. APPROACHES FOR POKA-YOKE

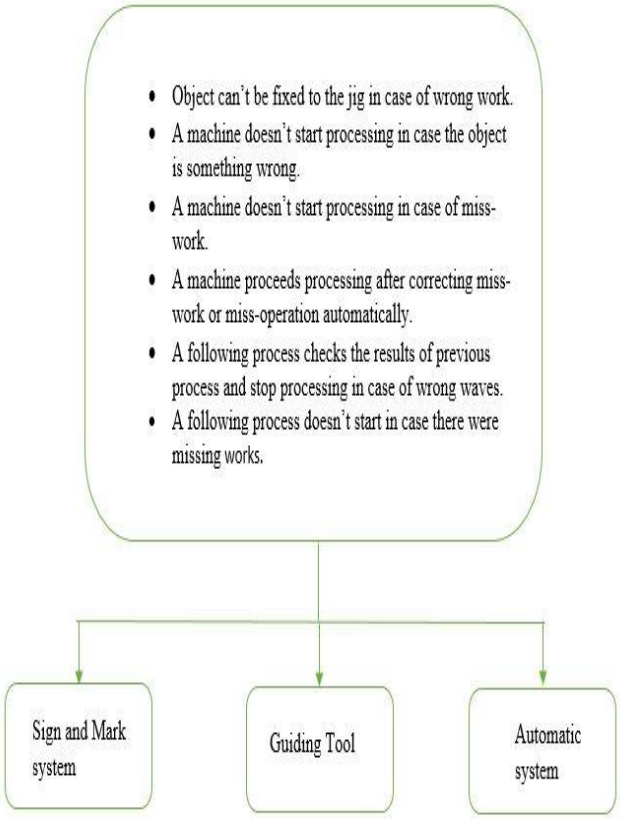

**Fig.no 3: Approaches for Poka-Yoke**

## V. POKA-YOKE METHODOLOGY

| Identify Problem |
|---|
| Observation at workstation |
| Brainstorming for idea |
| Select the best idea |
| Implementation Plan |
| Implement |
| Monitor and sign off |

At the point when a top organization chooses to established TPM culture in the company than to pay compensation deformity free items adequately one ought to pursue the accompanying technique.

1. Recognize issue
2. working environment's observation
3. new thought's from brainstorming
4. Select finest thought
5. Strategy for execution and usage
6. Monitoring and close down

Continuous improvement PDCA cycle with using Poka-Yoke Method

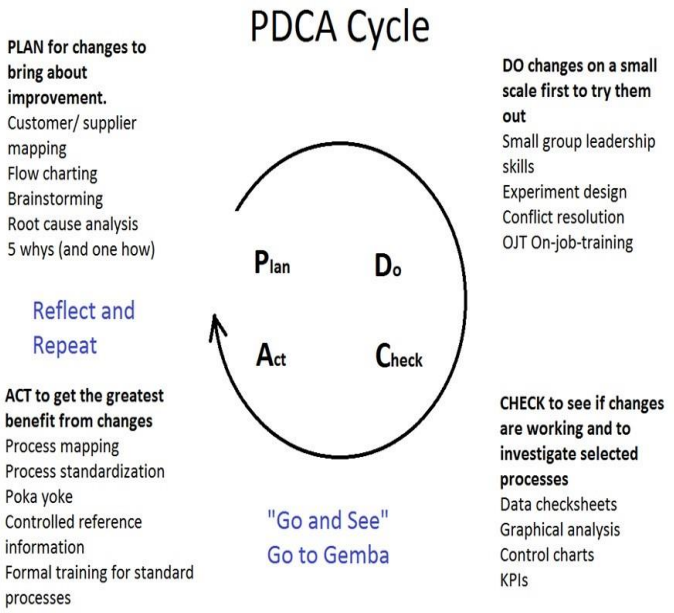

**Fig. no. 4: PDCA cycle for Poka-Yoke**

Here is a summary of some most essential errors achieved by overseers as underneath

1) The errors on account of the misconception

2) Incorrect conspicuous confirmation

3) Equipment maintenance errors

4) Adjustment, estimation, dimensional mistakes

5) Processing errors(some product was done inappropriately)

6) An erroneous part/item was incorporated

7) Assembly oversights (an area was overlooked)

8) Error in setting up the workpiece

9) Operations errors(deficient information, Lack of preparing, a technique not pursued)

10) Wrong workpiece

11) Processing oversights (a stage was overlooked)

12) Good intention anyway improperly executed

All mistakes rising in the association are kept on record and a while later explored. By far most of them stays away from using systems Poka-Yoke.

## VI. WORKING OF POKA-YOKE

Exactly when the product is being delivered, the faulty products are created. To diminishes the faulty items, during assembling of items at the essential period of harmed product at a particular machine it is to be recognized. By then the concerned individual will predict the condition and defective root main driver of that item. Further one needs to go to avoid abnormality by controlling the wrong activity and the ready system is to be made. In case the product made is past the resilience extent, it is of no use to stop that product to move further in the assembling procedure. This will in this way control the stream. Thusly a control system will be made by the ready system and stop the assembling of the harmed products further.

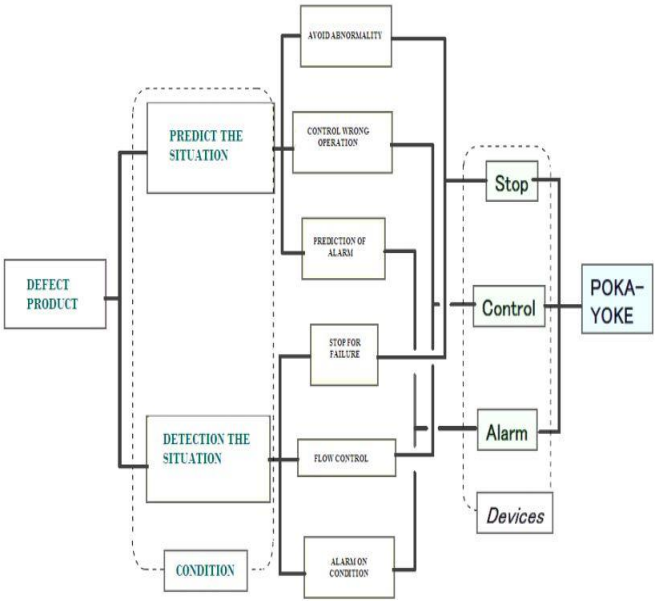

**Fig. 6: Working of Poka-Yoke**

## VII. SAMPLES OF POKA-YOKE

1. The connection for USB on the PC is organized so we can't relate pen drive or any contrasting pin in a backwards or erroneous way. It is a controlled Poka-Yoke system

2. Axle of CNC machine starts basically subsequent to shutting the safety door. In case the door is open, by then the machine won't run. It is closed down Poka-Yoke to avoid accidents.

3. The guide pins are used in venturing kicks the can for the right course of action of the upper and lower segments. In case there is improper planning get together of bites the dust won't occur. It is closed down Poka-Yoke.

4. In PC when we use Microsoft Office, if need to close record it generally requests spare it or drops. It is cautioning Poka-Yoke

## VIII. CONCLUSION

For doing errors we can't charge the individual for each and every mistake. Similarly error, insight is additionally individual's behavior. As Poka-Yoke is just the face of that information. We are able to dodge from the errors at the source itself by using the recently referenced system. About error proofing, it's possible that it is a technique for sifting through work that discards any chances of mistakes by the new user also. It likewise empowers the client to work without errors will occur. All together to complete a quality administration system adequately every activity should point towards greatness. Poka-Yoke is the best tools in TQM. There may be a few impediments in Poka-Yoke anyway is to beat all that for accomplishing the point of "Zero Defects, Zero Waste and Zero Delays". Powerful Poka-Yoke achieves increment productivity with least waste (waste due to recovering, scrap) since we make sure about the nature of the item, as errors are discouraged at the source itself.
