## Abstract:

This study is a Computer Based application which gives online medical services to the people at their doorstep. This study is help village level people to provide the medical facilities, Where doctors are unavailable. There are basically three users, patients, non-members and administrators. All the users have their own username and password. Patients can login to the site, give their symptoms, and answer to our questions, then they can receive diagnose and suggest the medicines. By using the diagnose the user can get the medicines by local chemist. Doctors can join to this site for viewing and correcting the disease cure. Administrators have the authority to add/delete users, write relevant queries to retrieve any information from the database.

**Keywords:** Computer Based Healthcare Information System, E Health Care Advisor, Unified Modelling Language (UML).

## 1. INTRODUCTION

**E HEALTH CARE ADVISOR** is computer based health care information system is an interactive blog on diseases. Users in this health care system are Patients, non-members and administrators. Users can login to this site and by answering to some questions they get diagnose report so that patients can get the medicines at local chemist without any prescription. Doctors can also login to this site to verify their doubts and also to upload new information. Administrators can also login to this site to maintain database, secure patients list and upload information.

## 2. OBJECTIVES

To create and implement a computer based Healthcare Information System.

## 3. METHODOLOGY

### 3.1 Methodology overview

- There are basically three users- patients, non-members and administrator.
- All the users have their own username and password.
- Patients can login to the site, give their symptoms, and answer to our questions, then they can receive the diagnose.
- By using the diagnose the user can get the medicines by local chemist.

- Doctors can join to this site for viewing and correcting the disease cure .
- Admin has the authority to add/delete users, write relevant queries to retrieve any information from the database.

### 3.2 Software Requirements Specification

#### 3.2.1 Unified Software Development

The Unified Software Development Process (Unified Process) is a process that uses the Unified Modelling Language(UML) to prepare the blueprints of a software system. USDP is the iterative and incremental software engineering process for the UML.

- We opted to use the UML, together with elements of the Unified Software Development Process for our design process.

### Phases and Workflows

### 3.3 Product Perspective

The proposed system is an application used by the patients, doctors and also by the administrator. This system will provide the administrator to add data to the database and also can take the decisions. The product perspective is to conduct diagnose to identify the diseases.

or delete users to the system and update according to the data base.

### 3.5 Resource

- Patient can get prescription from a certified and valid doctor.
- Patients can be able to view the list of patients diagnosed.

### 3.4. Functional Requirements

#### 3.4.1 Registration

Only registered users should be able to use resources in the system. Patients can post their problem and get the diagnostics verified prior by the doctor. Doctors can upload the information about diseases and provide prescriptions and can download the patient list and their reports. Administrator must be able to add

#### 3.5.1 Software Interface

**Front End:** Web Browser, Operating System (any)

**Web Server:** APACHE, Operating System (any)

**Data Base Server:** MYSQL, Operating System (any)

**End Development:** eclipse (servlets, jsp, html, css)

#### 3.5.2 Hardware Interface

| Soft ware   | Processor                | RAM   | Diskspace |
|-------------|--------------------------|-------|-----------|
| Any browser | Intel Pentium IV at 1GHz | 512MB | 2GB       |

| Server side |                             |     |                          |
|-------------|-----------------------------|-----|--------------------------|
| Apache      | Intel Pentium IV at GHz     | 1GB | 2GB                      |
| Mysql       | Intel Pentium IV at 2.6 GHz | 1GB | 2GB(Excluding Data size) |

### 3.5.3 Constraints

Patients, non-members and administrators are only eligible for using this E HEALTH

CARE ADVISOR. All the fields should be filled during /login.

## 4.RESULT&DISCUSSION

### 4.1 Use Case Diagram

USE-CASE FOR PATIENT, DOCTOR AND ADMININISTRATOR:

**Step 1:** In this Figure Consists Mainly Divided into 3 Parts: 1. Patient 2. Member 3. Admin

**Step 2:** Patient Login and Update the Details.

**Step 3:** Patient Enter the Symptoms and Get Relevant Description of the Particular Symptom.

**Step 4:** Member and Admin view the patient list

**Step 5:** Member Logout and that details send to the Admin

**Step 6:** Admin Update and Maintain the Database and Generate Reports.

### 4.2 Sequence Diagram

Time ordering messages the sequential steps of data flow UML

1. Flow chart of User Login

|         |  |        |  |          |  |
|---------|--|--------|--|----------|--|
| patient |  | system |  | database |  |
|---------|--|--------|--|----------|--|

**Steps for Sequence Diagram: (Main Roles : System, Patient, Database)**

**System** : Display the Login Page

**Patient** : Provided Username and Password

**System** : Checks Username and Password is Correct or Not

**Database**: sends the Incorrect Username and Password

**System** : Display login page with Message

**Patient**: Provide Correct username and Password

**System** : Username and Password checking

**Database**: sending of correct Username and Password

**System** : Display a Home Page

## 2. SEQUENCE DIAGRAM FOR PATIENT FOR DIAGNOSTICS

**Steps (Main Roles: Patient, System, and Database)**

**Step 1: Patient**: Gives Problem or Symptoms

**Step 2: System**: Check Symptoms in the database

**Step 3: Database**: add to patient List

**Step 4: Database**: Retrieve Corresponding Prescription

**Step 5: System**: Sends the acknowledgement

### 3. SEQUENCE DIAGRAM FOR DOCTOR TO UPLOAD INFORMATION:

Steps (Roles: Doctor, System, and Database)

Step 1: Doctor : Request the update Page

Step 2: System: Displays the update page

Step 3: Doctor : Gives answer to the Queries

Step 4: System : Upload into the Database

Step 5: Database: Update Corresponding records into the Database

Step 6: Database: Sends Acknowledgement report to the Doctor

#### 4.3 Activity Diagram: User Registration Steps for Activity Diagram:

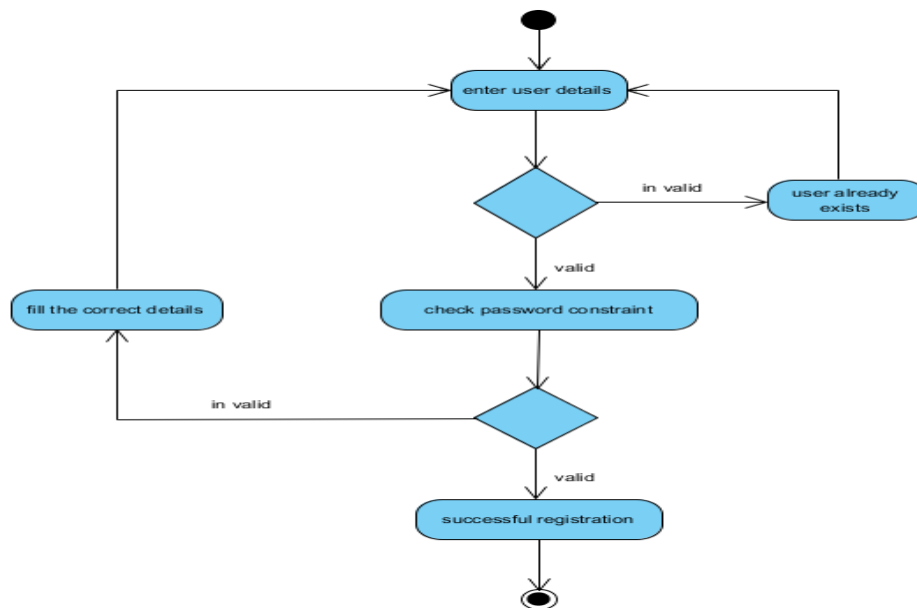

**Step 1:** Registration.

**Step 2:** Entry of User details

**Step 3:** if username is invalid it display a message user is already exists and displays the User details page.

**Step 4:** if username is Valid check password Constraint.

**Step 5:** if it is valid Registration it displays a Successful Registration. In case it is in valid display a message fills the correct details and displays the user details page.

#### USER LOGIN

##### Steps for User Login Page :

**Step 1:** Starting of Login Page

**Step 2:** Entry of Details

**Step 3:** Check Username and Password

**Step 4:** Valid Username and Password it will displays a Home Page otherwise go to Enter Details Page

#### PATIENT TREATMENT

##### Steps for the Patient Treatment:

**Step 1:** Start the Login Page

**Step 2:** Entry of Username and Password

**Step 3:** Checking of it's Valid Username and Password. if it is un valid go to login page with error message

**Step 4:** if Username and Password is Valid. Given the Problem Symptoms

**Step 5:** if it is not valid / not found it will give a questions .if it is valid

displayRelevant description of the particular symptom

**Step 6:** the questions is valid gives Prescription if it is not valid / wrong answer it Will displays the Unavailable

#### DOCTOR TO UPLOAD INFORMATION

Steps for Doctor to upload Information:

**Step 1:** Start the Login Page

**Step 2:** Doctor Entry of Username and Password Details

**Step 3:** if it is valid get Queries otherwise displaysaerror message and go toLogin Page.

**Step 4:** once get queries and upload the answers

**Step 5:** Logout / Exit the Page

```

classDiagram
    class patient {
        -p_id
        -name
        -age
        +givesymptoms()
    }
    class doctor {
        -doc_id
        -specialization
        -name
        +answer()
    }
    class symptom {
        -sym_1
        -sym_2
        -sym_3
        -disease
        +validate()
        +post()
    }
    class update_base {
        -sym
        -disease
        -prescription
        +getupdate()
        +post()
    }
    class disease_base {
        -sym
        -disease
        -prescription
        +getupdate()
        +deliver()
    }
    patient "0..*" -- "0..*" doctor
    patient "0..*" -- "0..*" symptom
    symptom "0..*" -- "0..*" update_base
    symptom "0..*" -- "0..*" disease_base
    doctor "0..*" -- "0..*" update_base
    doctor "0..*" -- "0..*" disease_base
    
```

The diagram illustrates the following classes and their relationships:

- patient** class: Attributes include `-p_id`, `-name`, and `-age`. It has a method `+givesymptoms()`.
- doctor** class: Attributes include `-doc_id`, `-specialization`, and `-name`. It has a method `+answer()`.
- symptom** class: Attributes include `-sym_1`, `-sym_2`, `-sym_3`, and `-disease`. It has methods `+validate()` and `+post()`.
- update\_base** class: Attributes include `-sym`, `-disease`, and `-prescription`. It has methods `+getupdate()` and `+post()`.
- disease\_base** class: Attributes include `-sym`, `-disease`, and `-prescription`. It has methods `+getupdate()` and `+deliver()`.

Relationships (Associations) are shown as follows:

- patient** (0..\*) is associated with **doctor** (0..\*).
- patient** (0..\*) is associated with **symptom** (0..\*).
- symptom** (0..\*) is associated with **update\_base** (0..\*).
- symptom** (0..\*) is associated with **disease\_base** (0..\*).
- doctor** (0..\*) is associated with **update\_base** (0..\*).
- doctor** (0..\*) is associated with **disease\_base** (0..\*).

### 5. Disease\_Base consists System, Disease and Prescription

- Doctor wants to see the symptoms and update the symptoms, disease and Prescription and wants to go to disease base it consists symptoms, Disease and Prescription displays the Symptoms Prescription and sends the Patient.

The ER diagram illustrates the following components:

- Entities and Attributes:**
  - patient** (blue rounded rectangle): Attributes include p\_id, f\_name, l\_name, age, time\_login, and time\_logout.
  - doctor** (blue rounded rectangle): Attributes include d\_id, name, doc\_id, specialization, time\_login, and time\_logout.
  - symptoms** (blue rounded rectangle): Attributes include symp\_1, symp\_2, and symp\_3.
  - disease\_base** (blue rounded rectangle): Attributes include symp\_1, disease, and prescription.
  - update\_base** (blue rounded rectangle): Attributes include symp, disease, and prescription.
- Relationships (diamonds):**
  - post** (yellow diamond): Connects **patient** and **symptoms**.
  - delivers to** (light blue diamond): Connects **patient**, **symptoms**, and **disease\_base**.
  - reports to** (purple diamond): Connects **doctor** and **disease\_base**.
  - update** (red diamond): Connects **doctor** and **update\_base**.
  - diagnose from** (red diamond): Connects **symptoms** and **disease\_base**.
  - adds to** (light blue diamond): Connects **disease\_base** and **update\_base**.
